Speech subject: Co-Packaged Optics - Heterogeneous Integration of Photonic IC and Electronic IC

Speech leader: John H Lau——Unimicron Technology Corporation

Speech Description/Objective:

Silicon photonics are the semiconductor integration of EIC and PIC on a silicon substrate (wafer) with complementary metal-oxide semiconductor (CMOS) technology. On the other hand, co-packaged optics (CPO) are heterogeneous integration packaging methods to integrate the optical engine (OE) which consists of photonic ICs (PIC) and the electrical engine (EE) which consists of the electronic ICs (EIC) as well as the switch ASIC (application specific IC). The advantages of CPO are: (a) to reduce the length of the electrical interface between the OE/EE (or PIC/EIC) and the ASIC, (b) to reduce the energy required to drive the signal, and (c) to cut the latency which leads to better electrical performance. In the next few years, we will see more implementations of a higher level of heterogeneous integration of PIC and EIC, whether it is for performance, form factor, power consumption or cost. In this lecture, on-board optics (OBO), near-package optics (NPO), and CPO will be discussed. Emphasis is placed on the trends of heterogeneous integration of PIC, EIC, and ASIC switch w/o bridges on various co-packaged substrates which including the glass core substrates.

Introduction of Speaker:

John H Lau, with more than 40 years of R&D and manufacturing experience in semiconductor packaging, has published more than 530 peer-reviewed papers (385 are the principal investigator), 52 issued and pending US patents (31 are the principal inventor), and 23 textbooks (all are the first author). John is an elected IEEE fellow, IMAPS Fellow, and ASME Fellow and has been actively participating in industry/academy/society meetings/conferences to contribute, learn, and share.
